Combination of measurements of the top quark mass from data collected by the ATLAS and CMS experiments at $\sqrt{s} = 7$ and 8 TeV

The ATLAS and CMS Collaborations*

Abstract

A combination of fifteen top quark mass measurements performed by the ATLAS and CMS experiments at the LHC is presented. The data sets used correspond to an integrated luminosity of up to 5 and 20 fb⁻¹ of proton-proton collisions at center-of-mass energies of 7 and 8 TeV, respectively. The combination includes measurements in top quark pair events that exploit both the semileptonic and hadronic decays of the top quark, and a measurement using events enriched in single top quark production via the electroweak t -channel. The combination accounts for the correlations between measurements and achieves an improvement in the total uncertainty of 31% relative to the most precise input measurement. The result is $m_t = 172.52 \pm 0.14$ (stat) ± 0.30 (syst) GeV, with a total uncertainty of 0.33 GeV.

Published in Physical Review Letters as doi:10.1103/PhysRevLett.132.261902.

The mass of the top quark (m_t) is a fundamental parameter of the standard model (SM). Its precise measurement provides a crucial input to fits that probe the consistency of the SM [1–5]. The Tevatron experiments CDF and D0 were the first to measure m_t [6, 7], and produced a combined result in 2016 [8]. During the 2011–2012 data-taking period of the CERN LHC, proton-proton collisions at $\sqrt{s} = 7$ and 8 TeV produced large numbers of top quarks in pairs via strong interactions or singly via electroweak processes. The two general-purpose experiments at the LHC, ATLAS [9] and CMS [10], performed multiple measurements of m_t using these data [11–24]. In this Letter, a combined m_t measurement from the ATLAS and CMS experiments is published for the first time. The 15 input measurements utilize up to 5 (20) fb^{-1} of integrated luminosity per experiment at 7 (8) TeV. A detailed estimate of the correlations between the ATLAS and CMS measurements is performed and the measurements are combined using the best linear unbiased estimate (BLUE) method [25, 26]. Not included in this combination are recent measurements of m_t performed with a partial 13 TeV data set [24, 27–33], for which the correlations have not yet been studied in detail. These measurements include new analysis techniques and the most precise measurement to date, made by CMS, with an uncertainty of 0.37 GeV [33].

The final state of events containing top quarks is determined by the decay of the W bosons produced in the top quark decays. In the top quark pair ($t\bar{t}$) production mode, ATLAS and CMS have made measurements in the dilepton ($t\bar{t} \rightarrow \ell^+ \nu_b \ell^- \bar{\nu}_b$), lepton+jets ($t\bar{t} \rightarrow \ell^\pm \nu_b q \bar{q}' \bar{b}$), and all-jets ($t\bar{t} \rightarrow q \bar{q}' b q \bar{q}' \bar{b}$) channels. In addition, CMS has performed a measurement using single top quark ($t \rightarrow \ell^+ \nu_b$, $\bar{t} \rightarrow \ell^- \bar{\nu}_b$) events.

In the dilepton channel, ATLAS uses the average invariant mass of the two lepton and b-tagged jet pairs as the observable sensitive to m_t [15, 18], where a b-tagged jet is any reconstructed jet identified as being likely to originate from a b quark. At $\sqrt{s} = 7$ TeV, CMS uses a kinematic reconstruction with the analytical matrix weighting technique [12] and at $\sqrt{s} = 8$ TeV CMS performs a fit to two dedicated observables [22] to simultaneously extract m_t and the global jet energy scale (JES). In the lepton+jets channel [11, 15, 16, 23], both experiments perform a kinematic fit on an event-by-event basis to reconstruct the top quark mass and the invariant mass of the hadronically decaying W boson. The latter is used to constrain the global JES. In addition, ATLAS fits a scale factor for the relative JES between jets originating from b quarks (b quark jets) and light quark / gluon jets [15, 23]. For the all-jets channel, ATLAS uses the ratio of the reconstructed top quark mass to the reconstructed W boson mass [14, 20] to extract m_t , while CMS fits the reconstructed top quark mass [13] directly, and at 8 TeV exploits the larger data sample to constrain the global JES using the reconstructed W boson mass [16].

The CMS single top quark analysis fits the invariant mass of the lepton, neutrino, and b-tagged jet [21] to extract m_t . Two additional CMS measurements [17, 19] use observables built only from leptons and charged-particle tracks, resulting in m_t measurements with low sensitivity to the JES uncertainties. The J/ψ analysis uses the invariant mass of the lepton and the two muons from the J/ψ meson decay [19]. The secondary vertex analysis uses the invariant mass of the lepton and the charged particles from a displaced secondary vertex [17]. Both measurements use $t\bar{t}$ events from the dilepton and lepton+jets decay modes.

All m_t measurements are calibrated using Monte Carlo (MC) simulation. Matrix element (ME) calculations are performed at fixed order in quantum chromodynamics (QCD) and interfaced to a parton shower (PS) algorithm that provides resummation of soft and collinear QCD radiation and a hadronization model that simulates the nonperturbative formation of hadrons. The POWHEG [34–36] generator at next-to-leading-order (NLO) in the strong coupling constant is interfaced with PYTHIA6 [37] to simulate $t\bar{t}$ production in the ATLAS measurements. The CMS measurements use the MADGRAPH5 [38] generator, which includes leading-order (LO) terms

for $t\bar{t}$ production with up to three additional partons, also interfaced with PYTHIA6. The top quark mass is a renormalization-scheme-dependent parameter in perturbative quantum field theory. The precise identification of the m_t parameter in MC simulations within a field-theoretic mass scheme is the subject of theoretical studies [39–42].

The BLUE method defines the estimator $m_t = \sum_i w^i m_t^i$ for the input measurements m_t^i . The weights w^i are determined by minimizing the uncertainty in m_t , where the covariance between each pair of measurements is the crucial input. The individual analyses i are defined to be orthogonal, such that each measurement is statistically uncorrelated with every other measurement. The exception is the CMS secondary vertex analysis [17], which overlaps statistically with the dilepton and lepton+jets measurements [16, 22]. Given the different nature of the observable in the secondary vertex analysis, the analyses are assumed to be uncorrelated. Taking the maximal statistical correlation allowed by the overlap produces no significant impact on the combination.

The measurements are affected by similar systematic uncertainties, and the assessment of their correlation is central to the combination. As the treatment of systematic uncertainties differs between ATLAS and CMS, for each measurement they are mapped onto 25 categories that group together similar sources of uncertainties. Uncertainty categories can influence m_t in opposite directions for different measurements, as seen in the ATLAS combinations [15, 23], and this effect is included via negative correlations. The correlations between pairs of measurements from a single experiment for each category are evaluated by summing the covariance matrices of all the input uncertainty sources, mainly using the correlation assumptions discussed in Refs. [16, 23]. Differences relative to Refs. [16, 23] are discussed in Appendix A. Each input uncertainty source is included irrespective of whether it is statistically significant.

The correlation strength ρ between ATLAS and CMS for each uncertainty category is assessed based on the similarities of the underlying models and methods, and of the estimates used. Three different cases are identified, with corresponding assumed correlation strengths: $\rho = 0.85$ (strongly correlated), $\rho = 0.5$ (partially correlated), and $\rho = 0$ (uncorrelated). No category was identified to have $\rho = 1$, which reflects the many differences between the two experiments. The correlation coefficient between an ATLAS and CMS measurement for each category is the product of the respective correlation strength and the signs of the impacts of that category on each measurement. In this way, for a given pair of measurements, categories that impact m_t in the same (opposite) direction have a positive (negative) correlation. For categories composed of multiple uncertainty sources (e.g., b tagging in ATLAS), the sign of the combined impact is not determined. In this case, the sign of the combined impact is assumed to be positive and it was checked that taking the alternative assumption of a negative sign does not significantly impact the result, with the largest change in the central value (uncertainty) being 41 (7) MeV. In calculating the final covariance matrix, it is assumed that each category is uncorrelated to the others.

Table 1 displays the correlation strengths between ATLAS and CMS for each systematic uncertainty category, and Appendix A provides tables with the uncertainties for all 15 measurements. The corresponding correlation coefficients are available in HEPData [44, 45]. The subsequent paragraphs outline the categorization of systematic uncertainties and their corresponding correlation assessments.

The JES uncertainty is important in many m_t measurements. Six categories are used to describe the uncertainties associated with the calibration of the JES that are in common between the experiments [46–49]. The category JES 1 includes contributions from the limited size of the data samples used to derive the JES corrections and contributions due to pileup and its time-

Table 1: Correlation strengths ρ of the systematic uncertainty categories between ATLAS and CMS, as used in the combination. The categories are defined in the text. Categories indicated with the symbol — in the second column correspond to uncertainties specific to a single experiment. The third column shows the range of ρ scanned for stability checks. The changes in the combination's central value m_t and uncertainty σ_{m_t} corresponding to each correlation variation are shown in the last two columns.

dependent variation. For ATLAS (7 TeV only), it also includes an uncertainty term from the effects of close-by jet activity. This category is uncorrelated between ATLAS and CMS measurements. The category JES 2 corresponds to the uncertainties from the absolute JES determined using γ/Z +jets events that are not included in JES 1. There are significant differences between the ATLAS and CMS approaches [46, 47], including differences in the jet radius, treatment of muons in jets, and methods to correct for additional radiation. Hence, this category is treated as uncorrelated. The category JES 3 corresponds to the modeling uncertainty in the relative η intercalibration [48, 49]. Both experiments use dijet events for this calibration, and the modeling uncertainty originates from the use of different generators to predict the radiation patterns in these events. As similar but not identical generators and techniques are used in both experi-

ments, JES 3 is treated as partially correlated.

The remaining JES categories correspond to the flavor-dependent calibration uncertainties. The category b-JES corresponds to the jet energy response uncertainty for b quark jets. The category g-JES corresponds to the uncertainty in the jet response of gluon jets for CMS and the uncertainty in the difference of the jet response of gluons to light-quark (u, d, s, c) jets for ATLAS. In both cases, MC comparisons determine the flavor-dependent effects, hence a strong correlation is used for the b-JES and g-JES components. The category l-JES includes the combined CMS uncertainty in the jet response of light-quark jets and the ATLAS uncertainty for the flavor composition of jets in $t\bar{t}$ events. As these uncertainty sources are different, the l-JES component is treated as uncorrelated. One additional flavor uncertainty category CMS JES 1 is included for the CMS 7 TeV measurements, corresponding to the full envelope of the response dependencies for gluons and all quark flavors.

The jet energy resolution (JER) uncertainty affects all measurements, and one category is used for the corresponding uncertainties. ATLAS and CMS both measure the JER using data [48, 49], hence this category is treated as uncorrelated.

The energy scale, efficiency, and resolution of leptons affect the m_t measurements, and one category is used for the corresponding uncertainties. ATLAS and CMS both calibrate the lepton energy scales, resolutions, and efficiencies using resonances that decay into dilepton pairs. Since the calibration samples are independent between the two experiments, and detector technologies and reconstruction algorithms are different, this category is treated as uncorrelated.

The selection criteria for many top quark measurements make use of b tagging. The uncertainty in the efficiency and rejection rate of these algorithms can impact the m_t measurements, and one category is used for the corresponding uncertainties. Both collaborations use dijet events to calibrate the b-tagging efficiency, employing equivalent methods [50, 51] that depend on similar simulation setups. As the ATLAS b jet calibration (unlike the CMS one) also uses $t\bar{t}$ events [50], this category is assessed as partially, rather than strongly, correlated.

The missing transverse momentum (p_T^{miss}) is estimated in the two experiments with different algorithms. Thus, the uncertainty in the p_T^{miss} scale originating from energy deposits not included in the reconstruction of jets or leptons is treated as uncorrelated.

The high instantaneous luminosity of the LHC results in multiple interactions in each bunch crossing (pileup). As the modeling of pileup relies on simulation, the correlation between ATLAS and CMS is assessed to be strong. While for other categories, the correlation strength is independent of the data set, the pileup category has zero correlation between analyses performed at 7 and 8 TeV due to the different pileup conditions in the two data sets.

The uncertainty in the efficiency of the triggers used to select events typically have a small impact on the measurements. As the triggers are calibrated in independent data sets, the uncertainty is treated as uncorrelated between ATLAS and CMS.

The m_t measurements rely on MC simulation of $t\bar{t}$ events to relate the reconstructed observables to m_t . The corresponding modeling uncertainties are encompassed in seven uncertainty categories. The category ME generator includes uncertainties originating from the choice of the ME generator. ATLAS assesses this uncertainty by comparing the results obtained using an MC@NLO [52, 53] sample with the POWHEG sample. CMS assesses this uncertainty by comparing the results obtained using a POWHEG sample with the MADGRAPH sample. As the experiments employ different nominal MC models, the category is treated as partially correlated. The category QCD radiation includes uncertainty sources for the modeling of QCD

radiation in $t\bar{t}$ events. For the ATLAS measurements, samples with parameter variations of the initial- and final-state radiation in PYTHIA, and the h_{damp} parameter in POWHEG (which controls ME/PS matching and effectively regulates high- p_T QCD radiation) are used to evaluate these uncertainties. For the CMS measurements, samples with variations of the factorization, renormalization, and matching scales are used. Similarly to the ME category, the QCD radiation category is treated as partially correlated between the two experiments.

In the ATLAS analyses, the uncertainty originating from the hadronization model is evaluated by using an alternative PS and hadronization generator (POWHEG+HERWIG6 [54]). CMS addresses similar uncertainties by separately varying the b quark fragmentation function and the semileptonic branching ratios (CMS b hadron $\mathcal{B}$). As the ATLAS approach changes many aspects of the simulation that are not changed in the two CMS uncertainty sources and the PYTHIA settings in the two experiments are not the same, there is no clear mapping and correlation for these sources. Nevertheless, some degree of correlation is expected, hence the ATLAS hadronization uncertainty is grouped with the CMS uncertainty from the fragmentation model in the category hadronization and this category is assumed to be partially correlated between the experiments. The CMS b hadron $\mathcal{B}$ uncertainty source is treated as uncorrelated with the ATLAS uncertainties. It was verified that the alternative treatment of correlating the ATLAS hadronization uncertainty with the CMS b hadron $\mathcal{B}$ uncertainty had no significant impact on the result.

The uncertainties associated with color reconnection and the underlying event tunes are included in separate categories. The experiments use different PYTHIA settings for the nominal simulation, and these uncertainty categories are taken to be partially correlated. The uncertainty in the parton distribution functions (PDFs) is driven by the input data used in the PDF extractions, and hence this category is taken as strongly correlated between ATLAS and CMS. The CMS analyses account for an uncertainty in the modeling of the top quark p_T distribution, represented by a separate category, while for the ATLAS analyses, the alternative MC sample used to evaluate the hadronization uncertainty covers the disagreement between data and simulation [55], and no additional uncertainty is evaluated.

The analyses typically have small contributions from background processes, and background uncertainties have only a small impact on the measurements. Uncertainties in backgrounds estimated from data control samples are included in the category Background (data), treated as uncorrelated between the experiments. Both ATLAS and CMS rely on MC simulation for several backgrounds. The uncertainties in these are included in the category Background (MC), assumed to be strongly correlated.

Every analysis ensures that the m_t fit is unbiased. This is done using simulated samples generated with different m_t values. The limited sample size introduces a systematic uncertainty (Method) that is statistical and hence uncorrelated between measurements.

A few systematic uncertainties affect only a limited number of analyses (see Appendix A). These uncertainty sources are in the category Other, which is uncorrelated between ATLAS and CMS.

The measurements from each experiment are separately combined, with the ATLAS combination giving $m_t = 172.71 \pm 0.25(\text{stat}) \pm 0.41(\text{syst}) \text{ GeV}$ and the CMS combination giving $m_t = 172.52 \pm 0.14(\text{stat}) \pm 0.39(\text{syst}) \text{ GeV}$. The ATLAS combination is very similar to, and supersedes, the result in Ref. [23], with the slight difference originating from changes in the correlation assumptions that are discussed in Appendix A. The CMS measurement is improved compared to the previous combination [16] and supersedes that result. The improvement orig-

Figure 1: Comparison of the individual m_t measurements and the result of the m_t combination. Also shown are the separate combinations of each experiment and the result of the simultaneous combination for the different decay channels, where the “other” category covers the single top, J/ψ , and secondary vertex measurements.

inates from including a more precise dilepton measurement at 8 TeV together with the single top, secondary vertex, and J/ψ meson measurements, and from including the effect of anticorrelations of the systematic uncertainties between the input measurements. It was verified that performing the combinations with a likelihood-based approach [56] gives identical results.

The combination of all 15 input measurements gives

$$m_t = 172.52 \pm 0.14 (\text{stat}) \pm 0.30 (\text{syst}) \text{ GeV},$$

which is compared with the input measurements in Fig. 1. The LHC combination has the same statistical uncertainty as the CMS combination. This is because the figure of merit in BLUE is the total uncertainty, and the statistical component is a consequence of the optimized weights in the combination. The difference in statistical uncertainty between ATLAS and CMS reflects different analysis choices, as explained in Appendix A.

The combination achieves an improvement in the total m_t uncertainty of 31% relative to the most precise input measurement. The measurements with the largest weight in the combination are the CMS 8 TeV lepton+jets (0.34), dilepton (0.12), and all-jets (0.12) results, and the ATLAS 8 TeV lepton+jets (0.17) and dilepton (0.16) measurements. The hierarchy of the weights originates from the uncertainty of each measurement, as well as the correlation between measurements. For example, the ATLAS 8 TeV lepton+jets measurement has a higher weight than the corresponding dilepton measurement, despite having a larger uncertainty. This is because of the smaller correlation with the precise CMS 8 TeV lepton+jets measurement. The combination shows good compatibility between the measurements, with $\chi^2 = 7.5$ and a corresponding

p -value of 91%. The LHC combination is much closer to the CMS combination than the ATLAS one because the relative weights of the measurements with slightly lower measured m_t are higher in the LHC combination than in the per-experiment combinations. All weights and the individual pulls can be found in Appendix A, along with a combination where all 15 measurements are used to extract separate m_t values for ATLAS and CMS.

Table 2 shows the breakdown of the systematic uncertainty in the combined measurement and the individual ATLAS and CMS combinations. The largest systematic uncertainties are seen to originate from JES, b tagging, and $t\bar{t}$ modeling. The stability of the measurement against the correlation assumptions is checked by varying the correlation strengths for each uncertainty category as shown in Table 1. The ranges reflect the extent of the understanding of the correlations. No variation is performed for categories where there is no ambiguity in the cor-

relation assumption. Table 1 shows the variation in the total uncertainty and central value of the combination under those changes. Both the central value and uncertainty are observed to vary linearly under the variations and the changes are small (<30 MeV) compared to the uncertainty in m_t . The largest change in central value is seen for b-JES, which is the leading correlated uncertainty source in the combination.

The consistency of the result and the measurements from the different decay channels have been checked by performing the combination with a separate m_t parameter for each $t\bar{t}$ decay channel. The results are also shown in Fig. 1, and the m_t values are found to be consistent.

The impact of the limited statistical precision of the estimates of the systematic uncertainties is evaluated by performing pseudo-experiments where the systematic uncertainties of the measurements are varied according to their uncertainties and the combination procedure is repeated. In this procedure, changes in the sign of the impacts of systematic uncertainties are propagated to the signs of the corresponding correlations. The root-mean-square of the measured m_t (σ_{m_t}) is found to be 63 (19) MeV, demonstrating the stability of the combination.

The understanding of top quark production and decay has continued to evolve since the publication of the measurements used in this combination. Developments in the simulations include improved modeling of off-shell effects [57], reduced uncertainties in additional QCD radiation [58, 59], new models of color reconnection [60, 61], MC simulations at next-to-NLO precision in QCD [62], and investigations into the radiation patterns in the top quark decay [63]. Advancements in the modeling, which may either increase or decrease the mass uncertainty, and improvements in analysis techniques [29, 33] are being incorporated into analyses performed at $\sqrt{s} = 13$ TeV, but this is not possible for the analyses used in this combination. A cross-check, detailed in Appendix A, was performed to verify that potential modeling uncertainties in the recoil in the top quark decay [63] do not significantly affect the combination.

In summary, a combination of top quark mass measurements by the ATLAS and CMS experiments at the CERN LHC in proton-proton collisions at $\sqrt{s} = 7$ and 8 TeV has been performed. The combination yields $m_t = 172.52 \pm 0.33$ GeV, which is the most precise result to date.

Acknowledgments

CMS congratulates our colleagues in the CERN accelerator departments for the excellent performance of the LHC and thank the technical and administrative staffs at CERN and at other CMS institutes for their contributions to the success of the CMS effort. In addition, we gratefully acknowledge the computing centres and personnel of the Worldwide LHC Computing Grid and other centres for delivering so effectively the computing infrastructure essential to our analyses. Finally, we acknowledge the enduring support for the construction and operation of the LHC, the CMS detector, and the supporting computing infrastructure provided by the following funding agencies: SC (Armenia), BMBWF and FWF (Austria); FNRS and FWO (Belgium); CNPq, CAPES, FAPERJ, FAPERGS, and FAPESP (Brazil); MES and BNSF (Bulgaria); CERN; CAS, MoST, and NSFC (China); MINCIENCIAS (Colombia); MSES and CSF (Croatia); RIF (Cyprus); SENESCYT (Ecuador); ERC PRG, RVTT3 and TK202 (Estonia); Academy of Finland, MEC, and HIP (Finland); CEA and CNRS/IN2P3 (France); SRNSF (Georgia); BMBF, DFG, and HGF (Germany); GSRI (Greece); NKFIH (Hungary); DAE and DST (India); IPM (Iran); SFI (Ireland); INFN (Italy); MSIP and NRF (Republic of Korea); MES (Latvia); LAS (Lithuania); MOE and UM (Malaysia); BUAP, CINVESTAV, CONACYT, LNS, SEP, and UASLP-FAI (Mexico); MOS (Montenegro); MBIE (New Zealand); PAEC (Pakistan); MES and NSC (Poland); FCT (Portugal); MESTD (Serbia); MCIN/AEI and PCTI (Spain); MOSTR (Sri Lanka); Swiss Funding

Agencies (Switzerland); MST (Taipei); MHESI and NSTDA (Thailand); TUBITAK and TENMAK (Turkey); NASU (Ukraine); STFC (United Kingdom); DOE and NSF (USA).

ATLAS thanks CERN for the very successful operation of the LHC and its injectors, as well as the support staff at CERN and at our institutions worldwide without whom ATLAS could not be operated efficiently.

The crucial computing support from all WLCG partners is acknowledged gratefully, in particular from CERN, the ATLAS Tier-1 facilities at TRIUMF/SFU (Canada), NDGF (Denmark, Norway, Sweden), CC-IN2P3 (France), KIT/GridKA (Germany), INFN-CNAF (Italy), NL-T1 (Netherlands), PIC (Spain), RAL (UK) and BNL (USA), the Tier-2 facilities worldwide and large non-WLCG resource providers. Major contributors of computing resources are listed in Ref. [64].

We gratefully acknowledge the support of ANPCyT, Argentina; YerPhI, Armenia; ARC, Australia; BMFWF and FWF, Austria; ANAS, Azerbaijan; CNPq and FAPESP, Brazil; NSERC, NRC and CFI, Canada; CERN; ANID, Chile; CAS, MOST and NSFC, China; Minciencias, Colombia; MEYS CR, Czech Republic; DNRF and DNSRC, Denmark; IN2P3-CNRS and CEA-DRF/IRFU, France; SRNSFG, Georgia; BMBF, HGF and MPG, Germany; GSRI, Greece; RGC and Hong Kong SAR, China; ISF and Benoziyo Center, Israel; INFN, Italy; MEXT and JSPS, Japan; CNRST, Morocco; NWO, Netherlands; RCN, Norway; MEiN, Poland; FCT, Portugal; MNE/IFA, Romania; MESTD, Serbia; MSSR, Slovakia; ARRS and MIZŠ, Slovenia; DSI/NRF, South Africa; MICINN, Spain; SRC and Wallenberg Foundation, Sweden; SERI, SNSF and Cantons of Bern and Geneva, Switzerland; MOST, Taipei; TENMAK, Türkiye; STFC, United Kingdom; DOE and NSF, United States of America.

A Supplemental material

A.1 Changes to the ATLAS correlations

Two changes in the correlation model for the ATLAS combination are made compared to Ref. [23]. The b tagging algorithm and calibration is different for the 8 TeV all-jets analysis compared to the lepton+jets and dilepton measurements. This prevents a precise correlation assessment for this source. Reference [23] assumed a correlation of +1 for this source between the all-jets and lepton+jets/dilepton measurements, and this is modified to 0 for this combination to reflect the use of a different algorithm. The pileup uncertainties were assumed to be uncorrelated between all the analyses in Ref. [23]. For this combination, the pileup uncertainty correlation is assumed to be +1 between each analysis at the same energy, reflecting the fact each analysis shares common modeling of the pileup. Zero correlation is assumed between the 7 and 8 TeV data sets, reflecting the significant difference in the pileup conditions. These two changes move the ATLAS combined m_t measurement by 20 MeV and have no impact on the uncertainty at the quoted precision.

A.2 Further details on the CMS correlations

Several changes in the correlation model for the CMS combination are made compared to Ref. [16]. To be consistent with the correlation model used in the ATLAS combination, the signs of systematic effects are accounted for, leading to negative signs for some of the correlations between analyses. In the previous CMS combination [16] all correlation signs were assumed to be positive. Another change compared to Ref. [16] is that the jet flavor uncertainties are assumed to be uncorrelated to match the ATLAS treatment, while in the original published analyses they were treated as fully correlated. In the updated CMS combination, the effect of this change on the central mass value (uncertainty) is 1 (10) MeV. The tables in the HEPData record [45] show the detailed correlations used in the combination. Sources of uncertainty of a statistical nature or that are unique to a specific analysis are considered uncorrelated between measurements. These include Background (data), Trigger, Method, and Other. JES 1 is assumed uncorrelated between 7 and 8 TeV and correlated otherwise, as it is of statistical nature but is common to measurements at the same center-of-mass energy. Similarly, Pileup is uncorrelated between 7 and 8 TeV. All other sources of uncertainty are considered fully correlated between all measurements.

A.3 Uncertainties in the Other category

The following uncertainty sources are included in the Other category:

- The uncertainties in single top quark modeling that impact the CMS single top quark measurement.
- The uncertainty in the modeling of the J/ψ meson candidate mass distribution that affects the CMS J/ψ measurement.
- The uncertainty in b hadron composition that impacts the CMS secondary vertex measurement.
- Lepton reconstruction and identification uncertainties for the CMS 8 TeV dilepton measurement. The other CMS lepton+jets and dilepton measurements assume that these uncertainties are negligible.
- The uncertainties in the efficiency of jet reconstruction and the selections used to reject jets from pileup that affect ATLAS measurements.

- The uncertainty originating from using fast simulation [65] in the ATLAS 7 TeV all-jets measurement. All other measurements use full simulation.

A.4 Cross-check on modeling of the recoil in the top quark decay

The PS simulation used in PYTHIA has an ambiguity in the choice of recoil particle in the case of additional gluon radiation in the top quark decay [63]. As the shower includes matrix element corrections, this ambiguity does not affect the first gluon emission, but only the subsequent emissions. The effect described in Ref. [63] is expected to mostly change the fraction of out-of-cone radiation of b quark jets. In the PYTHIA6 simulations used in the measurements that enter the combination, only one recoil scheme is available. The PYTHIA8 generator [66] offers the possibility to change the recoil scheme. Studies using generator-level PYTHIA8 samples (generated at $\sqrt{s} = 13$ TeV) show that changes in the reconstructed m_t seen when changing the recoil scheme from `RecoilToColoured=On` to `recoil-to-top` [32] correspond to a change in the b jet energy that is around 70% of the b-JES uncertainty. As a further cross-check, the combination was repeated by adding an additional uncertainty to each analysis equal to 70% of the b-JES uncertainty. The central value and uncertainty of the combination are observed to increase by 35 and 20 MeV respectively. These values are small compared to the total uncertainty, indicating that the result is robust against potential additional modeling uncertainties such as this.

A.5 Simultaneous ATLAS and CMS top quark mass combination

The compatibility of the ATLAS and CMS results is evaluated by performing a combination using all 15 input measurements with one m_t per experiment (m_t^{ATLAS} and m_t^{CMS}). This combination yields $m_t^{\text{ATLAS}} = 172.72 \pm 0.25$ (stat) ± 0.39 (syst) GeV and $m_t^{\text{CMS}} = 172.37 \pm 0.14$ (stat) ± 0.38 (syst) GeV, with excellent agreement seen between the two experiments. The larger statistical uncertainty in the ATLAS combination reflects the larger statistical uncertainties in the ATLAS analyses compared to the CMS analyses in the same channels, which in turn reflect the different analysis methods and choices. For example, the ATLAS lepton+jets measurements [11, 15, 23] fit a relative b-to-light JES factor, effectively trading smaller systematic uncertainty for larger statistical uncertainty. This result of the simultaneous combination is displayed in Fig. A.1, which compares the results of this simultaneous combination with the expectation $m_t^{\text{LHC}} = m_t^{\text{ATLAS}} = m_t^{\text{CMS}}$, the result of the default LHC combination using all 15 input measurements with a single extracted m_t (filled circle), and the results of the individual experiment combinations (red and blue lines), where m_t^{ATLAS} and m_t^{CMS} are extracted from separate combinations to the 6 ATLAS and 9 CMS measurements, respectively. In the simultaneous combination of all 15 measurements, all measurements contribute to the two parameters m_t^{ATLAS} and m_t^{CMS} , i.e., $m_t^{\text{ATLAS}} = \sum_i w_i m_i + \sum_j \lambda_j m_j$, where m_i are the ATLAS measurements and m_j are the CMS measurements. The weights, shown in Table A.1, satisfy $\sum_i w_i = 1$ and $\sum_j \lambda_j = 0$, and the equivalent condition applies to the weights for m_t^{CMS} . The χ^2 of this simultaneous combination is 7.2 (13 degrees of freedom), demonstrating no significant improvement in χ^2 over the single parameter combination (7.5 for 14 degrees of freedom). This reflects the excellent agreement between the ATLAS and CMS measurements of m_t .

A.6 Numerical details of the combination

Tables A.2 and A.3 show the ATLAS and CMS measurements together with the breakdown of their respective uncertainties, while Table A.4 shows the pull and weight of each input measurement in the LHC combination, as obtained with the BLUE method. The BLUE method can

Figure A.1: The simultaneous extraction of the m_t measured by ATLAS (m_t^{ATLAS}) and CMS (m_t^{CMS}) from a BLUE combination of the 15 input measurements is shown by the star. The solid ellipses show the regions allowed at 68 and 95% confidence level (CL) by the combination and are in good agreement with the expectation $m_t^{\text{ATLAS}} = m_t^{\text{CMS}}$ (shown by the black dashed line). The observed correlation between m_t^{ATLAS} and m_t^{CMS} is 0.15. The dashed blue and red lines and hashed bands show the central values and 68% CL intervals for the individual ATLAS and CMS combinations, which use the 6 ATLAS and 9 CMS measurements, respectively. In addition, the central value of the LHC combination, m_t^{LHC} , which assumes $m_t^{\text{LHC}} = m_t^{\text{ATLAS}} = m_t^{\text{CMS}}$, is shown by the circular marker. The projection of the corresponding diagonal error bar on either axis represents the total uncertainty m_t^{LHC} .

Table A.1: BLUE weights of the simultaneous ATLAS and CMS combination for each input measurement. The input measurements are the ATLAS and CMS 7 and 8 TeV m_t measurements in the dilepton (“dil”), lepton+jets (“lj”), and all-jets (“aj”) channels, and the CMS 8 TeV m_t measurements in the single top (“t”), secondary vertex (“vtx”), and J/ψ analysis (“J/ψ”). The sum of the ATLAS weights in the CMS combined value is zero, and vice versa. The individual weights, however, are different from zero due to the correlation between the different experiments. The weights are rounded to two decimal places; when the full precision is used, the weights for each of m_t^{ATLAS} and m_t^{CMS} sum to one.

	ATLAS						CMS								
	2011 (7 TeV)			2012 (8 TeV)			2011 (7 TeV)			2012 (8 TeV)					
	dil	lj	aj	dil	lj	aj	dil	lj	aj	dil	lj	aj	t	J/ψ	vtx
m_t^{ATLAS}	<0.01	+0.16	+0.04	+0.33	+0.36	+0.11	-0.05	-0.07	+0.03	+0.03	-0.11	+0.14	-0.03	+0.01	+0.05
m_t^{CMS}	-0.04	+0.01	-0.03	+0.04	+0.04	-0.02	-0.10	+0.02	+0.04	+0.18	+0.67	+0.10	-0.04	+0.01	+0.11

result in negative weights, as seen in Table A.4. This typically happens for measurements with a larger uncertainty than and high correlation to a more precise measurement [67]. Figure A.2 shows the correlation between each pair of measurements used in the LHC combination.

A simultaneous combination with one m_t parameter per each decay channel is performed to check the consistency of the result (Fig. 1 in the main document). Table A.5 shows the weights for this simultaneous combination. The “Other” channel includes the CMS single top, secondary vertex, and J/ψ analyses. The combined measurement for channel k is $m_t^k = \sum_i w_i m_i + \sum_j \lambda_j m_j$, where the sum over i includes all measurements of channel k and the sum over j includes all other measurements. The weights satisfy $\sum_i w_i = 1$ and $\sum_j \lambda_j = 0$. The correlations between the measurements result in nonzero values of the individual λ_j . The χ^2 of this simultaneous combination is 5.4 (11 degrees of freedom), corresponding to a p -value of 91%. The correlations between the m_t values extracted per channel are shown in Table A.6.

Figure A.2: Correlation matrix for the ATLAS and CMS 7 and 8 TeV m_t measurements in the dilepton (“dil”), lepton+jets (“lj”), and all-jets (“aj”) channels, and for the CMS 8 TeV m_t measurements in the single top (“t”), secondary vertex (“vtx”), and J/ψ analysis (“ J/ψ ”).

Table A.2: Results and systematic uncertainties of the ATLAS m_t measurements, shown separately for the 7 and 8 TeV results in the dilepton (“dil”), lepton+jets (“lj”), and all-jets (“aj”) channels, and for their combination (“comb.”). All values are given in GeV.

- ²⁸Also at RWTH Aachen University, III. Physikalisches Institut A, Aachen, Germany
- ²⁹Also at Isfahan University of Technology, Isfahan, Iran
- ³⁰Also at Bergische University Wuppertal (BUW), Wuppertal, Germany
- ³¹Also at Brandenburg University of Technology, Cottbus, Germany
- ³²Also at Forschungszentrum Jülich, Jülich, Germany
- ³³Also at CERN, European Organization for Nuclear Research, Geneva, Switzerland
- ³⁴Now at an institute or an international laboratory covered by a cooperation agreement with CERN
- ³⁵Also at Institute of Physics, University of Debrecen, Debrecen, Hungary
- ³⁶Also at Institute of Nuclear Research ATOMKI, Debrecen, Hungary
- ³⁷Now at Universitatea Babes-Bolyai - Facultatea de Fizica, Cluj-Napoca, Romania
- ³⁸Also at Physics Department, Faculty of Science, Assiut University, Assiut, Egypt
- ³⁹Also at HUN-REN Wigner Research Centre for Physics, Budapest, Hungary
- ⁴⁰Also at Punjab Agricultural University, Ludhiana, India
- ⁴¹Also at University of Visva-Bharati, Santiniketan, India
- ⁴²Also at Indian Institute of Science (IISc), Bangalore, India
- ⁴³Also at IIT Bhubaneswar, Bhubaneswar, India
- ⁴⁴Also at Institute of Physics, Bhubaneswar, India
- ⁴⁵Also at University of Hyderabad, Hyderabad, India
- ⁴⁶Also at Deutsches Elektronen-Synchrotron, Hamburg, Germany

⁴⁷Also at Department of Physics, Isfahan University of Technology, Isfahan, Iran

⁴⁸Also at Sharif University of Technology, Tehran, Iran

⁴⁹Also at Department of Physics, University of Science and Technology of Mazandaran, Behshahr, Iran

⁵⁰Also at Helwan University, Cairo, Egypt

⁵¹Also at Italian National Agency for New Technologies, Energy and Sustainable Economic Development, Bologna, Italy

⁵²Also at Centro Siciliano di Fisica Nucleare e di Struttura Della Materia, Catania, Italy

⁵³Also at Università degli Studi Guglielmo Marconi, Roma, Italy

⁵⁴Also at Scuola Superiore Meridionale, Università di Napoli 'Federico II', Napoli, Italy

⁵⁵Also at Fermi National Accelerator Laboratory, Batavia, Illinois, USA

⁵⁶Also at Laboratori Nazionali di Legnaro dell'INFN, Legnaro, Italy

⁵⁷Also at Ain Shams University, Cairo, Egypt

⁵⁸Also at Consiglio Nazionale delle Ricerche - Istituto Officina dei Materiali, Perugia, Italy

⁵⁹Also at Riga Technical University, Riga, Latvia

⁶⁰Also at Department of Applied Physics, Faculty of Science and Technology, Universiti Kebangsaan Malaysia, Bangi, Malaysia

⁶¹Also at Consejo Nacional de Ciencia y Tecnología, Mexico City, Mexico

⁶²Also at Trincomalee Campus, Eastern University, Sri Lanka, Nilaveli, Sri Lanka

⁶³Also at Saegis Campus, Nugegoda, Sri Lanka

⁶⁴Also at INFN Sezione di Pavia, Università di Pavia, Pavia, Italy

⁶⁵Also at National and Kapodistrian University of Athens, Athens, Greece

⁶⁶Also at Ecole Polytechnique Fédérale Lausanne, Lausanne, Switzerland

⁶⁷Also at Universität Zürich, Zurich, Switzerland

⁶⁸Also at Stefan Meyer Institute for Subatomic Physics, Vienna, Austria

⁶⁹Also at Laboratoire d'Annecy-le-Vieux de Physique des Particules, IN2P3-CNRS, Annecy-le-Vieux, France

⁷⁰Also at Near East University, Research Center of Experimental Health Science, Mersin, Turkey

⁷¹Also at Konya Technical University, Konya, Turkey

⁷²Also at Izmir Bakircay University, Izmir, Turkey

⁷³Also at Adiyaman University, Adiyaman, Turkey

⁷⁴Also at Bozok Universitetesi Rektörlüğü, Yozgat, Turkey

⁷⁵Also at Marmara University, Istanbul, Turkey

⁷⁶Also at Milli Savunma University, Istanbul, Turkey

⁷⁷Also at Kafkas University, Kars, Turkey

⁷⁸Now at Istanbul Okan University, Istanbul, Turkey

⁷⁹Also at Hacettepe University, Ankara, Turkey

⁸⁰Also at Istanbul University - Cerrahpasa, Faculty of Engineering, Istanbul, Turkey

⁸¹Also at Yildiz Technical University, Istanbul, Turkey

⁸²Also at Vrije Universiteit Brussel, Brussel, Belgium

⁸³Also at School of Physics and Astronomy, University of Southampton, Southampton, United Kingdom

⁸⁴Also at University of Bristol, Bristol, United Kingdom

⁸⁵Also at IPPP Durham University, Durham, United Kingdom

⁸⁶Also at Monash University, Faculty of Science, Clayton, Australia

⁸⁷Also at Università di Torino, Torino, Italy

⁸⁸Also at Bethel University, St. Paul, Minnesota, USA

⁸⁹Also at Karamanoğlu Mehmetbey University, Karaman, Turkey

- ⁹⁰Also at California Institute of Technology, Pasadena, California, USA
⁹¹Also at United States Naval Academy, Annapolis, Maryland, USA
⁹²Also at Bingöl University, Bingöl, Turkey
⁹³Also at Georgian Technical University, Tbilisi, Georgia
⁹⁴Also at Sinop University, Sinop, Turkey
⁹⁵Also at Erciyes University, Kayseri, Turkey
⁹⁶Also at Horia Hulubei National Institute of Physics and Nuclear Engineering (IFIN-HH), Bucharest, Romania
⁹⁷Also at Texas A&M University at Qatar, Doha, Qatar
⁹⁸Also at Kyungpook National University, Daegu, Korea
⁹⁹Also at another institute or international laboratory covered by a cooperation agreement with CERN
¹⁰⁰Also at Universiteit Antwerpen, Antwerpen, Belgium
¹⁰¹Also at Northeastern University, Boston, Massachusetts, USA
¹⁰²Also at Imperial College, London, United Kingdom
¹⁰³Now at Yerevan Physics Institute, Yerevan, Armenia
¹⁰⁴Also at Institute of Nuclear Physics of the Uzbekistan Academy of Sciences, Tashkent, Uzbekistan

⁹¹Physics Department, Lancaster University, Lancaster; United Kingdom.

⁹²Oliver Lodge Laboratory, University of Liverpool, Liverpool; United Kingdom.

⁹³Department of Experimental Particle Physics, Jožef Stefan Institute and Department of Physics, University of Ljubljana, Ljubljana; Slovenia.

⁹⁴School of Physics and Astronomy, Queen Mary University of London, London; United Kingdom.

⁹⁵Department of Physics, Royal Holloway University of London, Egham; United Kingdom.

⁹⁶Department of Physics and Astronomy, University College London, London; United

Kingdom.

⁹⁷Louisiana Tech University, Ruston LA; United States of America.

⁹⁸Fysiska institutionen, Lunds universitet, Lund; Sweden.

⁹⁹Departamento de Física Teórica C-15 and CIAFF, Universidad Autónoma de Madrid, Madrid; Spain.

¹⁰⁰Institut für Physik, Universität Mainz, Mainz; Germany.

¹⁰¹School of Physics and Astronomy, University of Manchester, Manchester; United Kingdom.

¹⁰²CPPM, Aix-Marseille Université, CNRS/IN2P3, Marseille; France.

¹⁰³Department of Physics, University of Massachusetts, Amherst MA; United States of America.

¹⁰⁴Department of Physics, McGill University, Montreal QC; Canada.

¹⁰⁵School of Physics, University of Melbourne, Victoria; Australia.

¹⁰⁶Department of Physics, University of Michigan, Ann Arbor MI; United States of America.

¹⁰⁷Department of Physics and Astronomy, Michigan State University, East Lansing MI; United States of America.

¹⁰⁸Group of Particle Physics, University of Montreal, Montreal QC; Canada.

¹⁰⁹Fakultät für Physik, Ludwig-Maximilians-Universität München, München; Germany.

¹¹⁰Max-Planck-Institut für Physik (Werner-Heisenberg-Institut), München; Germany.

¹¹¹Graduate School of Science and Kobayashi-Maskawa Institute, Nagoya University, Nagoya; Japan.

¹¹²Department of Physics and Astronomy, University of New Mexico, Albuquerque NM; United States of America.

¹¹³Institute for Mathematics, Astrophysics and Particle Physics, Radboud University/Nikhef, Nijmegen; Netherlands.

¹¹⁴Nikhef National Institute for Subatomic Physics and University of Amsterdam, Amsterdam; Netherlands.

¹¹⁵Department of Physics, Northern Illinois University, DeKalb IL; United States of America.

^{116(a)}New York University Abu Dhabi, Abu Dhabi; ^(b)United Arab Emirates University, Al Ain; United Arab Emirates.

¹¹⁷Department of Physics, New York University, New York NY; United States of America.

¹¹⁸Ochanomizu University, Otsuka, Bunkyo-ku, Tokyo; Japan.

¹¹⁹Ohio State University, Columbus OH; United States of America.

¹²⁰Homer L. Dodge Department of Physics and Astronomy, University of Oklahoma, Norman OK; United States of America.

¹²¹Department of Physics, Oklahoma State University, Stillwater OK; United States of America.

¹²²Palacký University, Joint Laboratory of Optics, Olomouc; Czech Republic.

¹²³Institute for Fundamental Science, University of Oregon, Eugene, OR; United States of America.

¹²⁴Graduate School of Science, Osaka University, Osaka; Japan.

¹²⁵Department of Physics, University of Oslo, Oslo; Norway.

¹²⁶Department of Physics, Oxford University, Oxford; United Kingdom.

¹²⁷LPNHE, Sorbonne Université, Université Paris Cité, CNRS/IN2P3, Paris; France.

¹²⁸Department of Physics, University of Pennsylvania, Philadelphia PA; United States of America.

¹²⁹Department of Physics and Astronomy, University of Pittsburgh, Pittsburgh PA; United States of America.

^{130(a)}Laboratório de Instrumentação e Física Experimental de Partículas - LIP, Lisboa; ^(b)Departamento de Física, Faculdade de Ciências, Universidade de Lisboa,

- Lisboa;^(c)Departamento de Física, Universidade de Coimbra, Coimbra;^(d)Centro de Física Nuclear da Universidade de Lisboa, Lisboa;^(e)Departamento de Física, Universidade do Minho, Braga;^(f)Departamento de Física Teórica y del Cosmos, Universidad de Granada, Granada (Spain);^(g)Departamento de Física, Instituto Superior Técnico, Universidade de Lisboa, Lisboa; Portugal.
- ¹³¹Institute of Physics of the Czech Academy of Sciences, Prague; Czech Republic.
- ¹³²Czech Technical University in Prague, Prague; Czech Republic.
- ¹³³Charles University, Faculty of Mathematics and Physics, Prague; Czech Republic.
- ¹³⁴Particle Physics Department, Rutherford Appleton Laboratory, Didcot; United Kingdom.
- ¹³⁵IRFU, CEA, Université Paris-Saclay, Gif-sur-Yvette; France.
- ¹³⁶Santa Cruz Institute for Particle Physics, University of California Santa Cruz, Santa Cruz CA; United States of America.
- ¹³⁷(^a)Departamento de Física, Pontificia Universidad Católica de Chile, Santiago;^(b)Millennium Institute for Subatomic physics at high energy frontier (SAPHIR), Santiago;^(c)Instituto de Investigación Multidisciplinario en Ciencia y Tecnología, y Departamento de Física, Universidad de La Serena;^(d)Universidad Andres Bello, Department of Physics, Santiago;^(e)Instituto de Alta Investigación, Universidad de Tarapacá, Arica;^(f)Departamento de Física, Universidad Técnica Federico Santa María, Valparaíso; Chile.
- ¹³⁸Department of Physics, University of Washington, Seattle WA; United States of America.
- ¹³⁹Department of Physics and Astronomy, University of Sheffield, Sheffield; United Kingdom.
- ¹⁴⁰Department of Physics, Shinshu University, Nagano; Japan.
- ¹⁴¹Department Physik, Universität Siegen, Siegen; Germany.
- ¹⁴²Department of Physics, Simon Fraser University, Burnaby BC; Canada.
- ¹⁴³SLAC National Accelerator Laboratory, Stanford CA; United States of America.
- ¹⁴⁴Department of Physics, Royal Institute of Technology, Stockholm; Sweden.
- ¹⁴⁵Departments of Physics and Astronomy, Stony Brook University, Stony Brook NY; United States of America.
- ¹⁴⁶Department of Physics and Astronomy, University of Sussex, Brighton; United Kingdom.
- ¹⁴⁷School of Physics, University of Sydney, Sydney; Australia.
- ¹⁴⁸Institute of Physics, Academia Sinica, Taipei; Taiwan.
- ¹⁴⁹(^a)E. Andronikashvili Institute of Physics, Iv. Javakhishvili Tbilisi State University, Tbilisi;^(b)High Energy Physics Institute, Tbilisi State University, Tbilisi;^(c)University of Georgia, Tbilisi; Georgia.
- ¹⁵⁰Department of Physics, Technion, Israel Institute of Technology, Haifa; Israel.
- ¹⁵¹Raymond and Beverly Sackler School of Physics and Astronomy, Tel Aviv University, Tel Aviv; Israel.
- ¹⁵²Department of Physics, Aristotle University of Thessaloniki, Thessaloniki; Greece.
- ¹⁵³International Center for Elementary Particle Physics and Department of Physics, University of Tokyo, Tokyo; Japan.
- ¹⁵⁴Department of Physics, Tokyo Institute of Technology, Tokyo; Japan.
- ¹⁵⁵Department of Physics, University of Toronto, Toronto ON; Canada.
- ¹⁵⁶(^a)TRIUMF, Vancouver BC;^(b)Department of Physics and Astronomy, York University, Toronto ON; Canada.
- ¹⁵⁷Division of Physics and Tomonaga Center for the History of the Universe, Faculty of Pure and Applied Sciences, University of Tsukuba, Tsukuba; Japan.
- ¹⁵⁸Department of Physics and Astronomy, Tufts University, Medford MA; United States of America.
- ¹⁵⁹Department of Physics and Astronomy, University of California Irvine, Irvine CA; United

States of America.

¹⁶⁰University of Sharjah, Sharjah; United Arab Emirates.

¹⁶¹Department of Physics and Astronomy, University of Uppsala, Uppsala; Sweden.

¹⁶²Department of Physics, University of Illinois, Urbana IL; United States of America.

¹⁶³Instituto de Física Corpuscular (IFIC), Centro Mixto Universidad de Valencia - CSIC, Valencia; Spain.

¹⁶⁴Department of Physics, University of British Columbia, Vancouver BC; Canada.

¹⁶⁵Department of Physics and Astronomy, University of Victoria, Victoria BC; Canada.

¹⁶⁶Fakultät für Physik und Astronomie, Julius-Maximilians-Universität Würzburg, Würzburg; Germany.

¹⁶⁷Department of Physics, University of Warwick, Coventry; United Kingdom.

¹⁶⁸Waseda University, Tokyo; Japan.

¹⁶⁹Department of Particle Physics and Astrophysics, Weizmann Institute of Science, Rehovot; Israel.

¹⁷⁰Department of Physics, University of Wisconsin, Madison WI; United States of America.

¹⁷¹Fakultät für Mathematik und Naturwissenschaften, Fachgruppe Physik, Bergische Universität Wuppertal, Wuppertal; Germany.

¹⁷²Department of Physics, Yale University, New Haven CT; United States of America.

^a Also Affiliated with an institute covered by a cooperation agreement with CERN.

^b Also at An-Najah National University, Nablus; Palestine.

^c Also at Borough of Manhattan Community College, City University of New York, New York NY; United States of America.

^d Also at Center for High Energy Physics, Peking University; China.

^e Also at Center for Interdisciplinary Research and Innovation (CIRI-AUTH), Thessaloniki; Greece.

^f Also at Centro Studi e Ricerche Enrico Fermi; Italy.

^g Also at CERN, Geneva; Switzerland.

^h Also at Département de Physique Nucléaire et Corpusculaire, Université de Genève, Genève; Switzerland.

ⁱ Also at Departament de Física de la Universitat Autònoma de Barcelona, Barcelona; Spain.

^j Also at Department of Financial and Management Engineering, University of the Aegean, Chios; Greece.

^k Also at Department of Physics, Ben Gurion University of the Negev, Beer Sheva; Israel.

^l Also at Department of Physics, California State University, Sacramento; United States of America.

^m Also at Department of Physics, King's College London, London; United Kingdom.

ⁿ Also at Department of Physics, Stanford University, Stanford CA; United States of America.

^o Also at Department of Physics, Stellenbosch University; South Africa.

^p Also at Department of Physics, University of Fribourg, Fribourg; Switzerland.

^q Also at Department of Physics, University of Thessaly; Greece.

^r Also at Department of Physics, Westmont College, Santa Barbara; United States of America.

^s Also at Hellenic Open University, Patras; Greece.

^t Also at Institutio Catalana de Recerca i Estudis Avancats, ICREA, Barcelona; Spain.

^u Also at Institut für Experimentalphysik, Universität Hamburg, Hamburg; Germany.

^v Also at Institute for Nuclear Research and Nuclear Energy (INRNE) of the Bulgarian Academy of Sciences, Sofia; Bulgaria.

^w Also at Institute of Applied Physics, Mohammed VI Polytechnic University, Ben Guerir; Morocco.

^x Also at Institute of Particle Physics (IPP); Canada.

^y Also at Institute of Physics and Technology, Mongolian Academy of Sciences, Ulaanbaatar; Mongolia.

^z Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku; Azerbaijan.

^{aa} Also at Institute of Theoretical Physics, Ilia State University, Tbilisi; Georgia.

^{ab} Also at L2IT, Université de Toulouse, CNRS/IN2P3, UPS, Toulouse; France.

^{ac} Also at Lawrence Livermore National Laboratory, Livermore; United States of America.

^{ad} Also at National Institute of Physics, University of the Philippines Diliman (Philippines); Philippines.

^{ae} Also at Technical University of Munich, Munich; Germany.

^{af} Also at The Collaborative Innovation Center of Quantum Matter (CICQM), Beijing; China.

^{ag} Also at TRIUMF, Vancouver BC; Canada.

^{ah} Also at Università di Napoli Parthenope, Napoli; Italy.

^{ai} Also at University of Chinese Academy of Sciences (UCAS), Beijing; China.

^{aj} Also at University of Colorado Boulder, Department of Physics, Colorado; United States of America.

^{ak} Also at Washington College, Chestertown, MD; United States of America.

^{al} Also at Yeditepe University, Physics Department, Istanbul; Türkiye.
